

Electrical socket/switch back-boxes - metal or plastic

Internally mounted

Rear mounted

The CP 617 Putty pad has been fully fire and acoustically tested 'back to back' to represent the most onerous orientation i.e. where fire and sound can pass directly from one socket to another.

Additional testing has also been conducted to provide up to 2 hrs fire performance where the sockets have been installed in the wall higher than 1 m from the floor. This again represents a more onerous application.
